QUESTION DESCRIPTION

The median of a list of numbers is essentially its middle element after sorting. The same number of elements occur after it as before. Given a list of numbers with an odd number of elements, find the **median**?

Example

arr = [5, 3, 1, 2, 4]

The sorted array $arr' = [1, 2, 3, 4, 5]$. The middle element and the median is **3**.

Function Description

Complete the *findMedian* function in the editor below.

findMedian has the following parameter(s):

- $int\ arr[n]$: an unsorted array of integers

Returns

- int : the median of the array

Input Format

The first line contains the integer n , the size of arr .

The second line contains n space-separated integers $arr[i]$

Constraints

- $1 \leq n \leq 1000001$
- n is odd
- $-10000 \leq arr[i] \leq 10000$

Sample Input 0

```
7
0 1 2 4 6 5 3
```

Sample Output 0

```
3
```

Explanation 0

The sorted $arr = [0, 1, 2, 3, 4, 5, 6]$. It's middle element is at $arr[3] = 3$.

CANDIDATE ANSWER

Language used: JavaScript (Node.js)

```
1
2  /*
3   * Complete the 'findMedian' function below.
4   *
5   * The function is expected to return an INTEGER.
6   * The function accepts INTEGER_ARRAY arr as parameter.
7   */
8
9  function findMedian(arr) {
10     // Write your code here
11     const sortedArray = arr.sort((a,b) => a - b);
12     return sortedArray[Math.trunc(sortedArray.length / 2)];
13
14 }
15
```

QUESTION DESCRIPTION

Sean invented a game involving a $2n \times 2n$ matrix where each cell of the matrix contains an integer. He can reverse any of its rows or columns any number of times. The goal of the game is to maximize the sum of the elements in the $n \times n$ submatrix located in the upper-left quadrant of the matrix.

Given the initial configurations for q matrices, help Sean reverse the rows and columns of each matrix in the best possible way so that the sum of the elements in the matrix's upper-left quadrant is maximal.

Example

$matrix = [[1, 2], [3, 4]]$

```
1 2
3 4
```

It is 2×2 and we want to maximize the top left quadrant, a 1×1 matrix. Reverse row 1:

```
1 2
4 3
```

And now reverse column 0:

```
4 2
1 3
```

The maximal sum is 4.

Function Description

Complete the `flippingMatrix` function in the editor below.

`flippingMatrix` has the following parameters:

- `int matrix[2n][2n]`: a 2-dimensional array of integers

Returns

- `int`: the maximum sum possible.

Input Format

The first line contains an integer q , the number of queries.

The next q sets of lines are in the following format:

- The first line of each query contains an integer, n .
- Each of the next $2n$ lines contains $2n$ space-separated integers $matrix[i][j]$ in row i of the matrix.

Constraints

- $1 \leq q \leq 16$
- $1 \leq n \leq 128$
- $0 \leq matrix[i][j] \leq 4096$, where $0 \leq i, j < 2n$.

Sample Input

```
14
15     for (let row = 0; row < halfMatrixSize; row++) {
16         for (let col = 0; col < halfMatrixSize; col++) {
17             let element = matrix.get(row).get(col);
18             let rightMirror = matrix.get(row).get(maxMatrixIndex - col);
19             let downMirror = matrix.get(maxMatrixIndex - row).get(col);
20             let rightDownMirror = matrix.get(maxMatrixIndex - row)
21                 .get(maxMatrixIndex - col);
22
23             result += Arrays.asList(element, rightMirror, downMirror,
24 rightDownMirror)
25                 .stream().max(Integer::compare).get();
26         }
27     }
28     return result;
29
30 }
```
